

Figma Prototype with explanation

This is the prototype of the login page to our eMagiz ticketing system, made on Figma. All screenshots of the prototype here on out will be of the Support role's view, however a description for Customer and Consultant roles will be provided. The screenshot above shows that users will have to sign in with their workspace account to access the system. This account is created by users with the Support role. The possible accounts that can access are Customer, Support and Consultant.

ASSIGNMENT 1: EMAGIZ 2

This is the prototype of our dashboard, which gives users quick access to the main functions of the system, and improves usability through GUI. From this page, users can create new tickets or view tickets that have already been created, which make the system simpler. Also, the main navigation starts here. The image above is for the Support role, which can also view audit logs.

The screenshot shows the 'Create Ticket' form in the eMagiz dashboard. The form is titled 'Create Ticket' and includes a subtitle 'Capture incidents, fixes, alerts, or internal support actions.' The form is divided into several sections: 'Ticket details', 'Source', 'Requester', 'Description', and 'Internal notes'. The 'Ticket details' section includes fields for 'Title' (with a placeholder 'Short summary of the request'), 'Type' (a dropdown menu with 'Incident' selected), 'Priority' (a dropdown menu with 'Medium' selected), and 'Deadline' (a date field with the placeholder 'dd / mm / yyyy'). The 'Source' section includes a dropdown menu with 'Internal' selected. The 'Requester' section includes a dropdown menu with 'Select customer' selected. The 'Description' section includes a text area with a placeholder 'Describe impact, affected integration, expected result, and urgency.' The 'Internal notes' section includes a text area with a placeholder 'Visible only to support roles.' At the bottom of the form are 'Cancel' and 'Create ticket' buttons.

From this page users can create new tickets. Users can enter a title and a description that explains the issue or request. After a ticket is submitted, it is stored in the database and can be reviewed or assigned later. Although not included in this prototype, our team plans on including a description for some advanced terms such as what 'RFC' means.

The screenshot shows the 'Tickets' list in the eMagiz dashboard. The page is titled 'Tickets' and includes a subtitle 'All tickets.' and a 'Create ticket' button. The page displays four summary cards: '24 Visible tickets', '6 Awaiting triage', '15 Incidents', and '9 RFCs'. Below the cards is a search bar with the placeholder 'Search by ID, title, requester, or description' and two dropdown menus for 'All statuses' and 'All types'. The main table lists tickets with columns: Ticket, Title, Type, Source, Requester, Status, Priority, Progress, and Deadline. The table contains 8 rows of data.

Ticket	Title	Type	Source	Requester	Status	Priority	Progress	Deadline
EP-1802		Incident	---		In Progress	Medium	---	---
EP-1802		RFC	---		Resolved	High	---	---
EP-1803		Incident	---		Open	Critical	---	---
EP-1804		RFC	---		In Progress	Low	---	---
EP-1805		Incident	---		Open	Medium	---	---
EP-1806		RFC	---		In Progress	High	---	---
EP-1807		Incident	---		Resolved	Critical	---	---
EP-1808		RFC	---		Open	Low	---	---

ASSIGNMENT 1: EMAGIZ 2

This page shows the created tickets, including the description. Customers can view their own tickets, Consultants can view tickets that have been assigned to them, and Support can view all tickets made.

The screenshot shows the 'Customers' management interface in eMagiz 2. On the left is a dark sidebar with navigation links: 'Dashboard', 'Tickets', 'Create', 'Customers' (selected), and 'Audit'. The main content area has a header 'Customers' with the subtitle 'Create and edit customer accounts'. Below this are two panels. The 'Create customer' panel on the left contains four input fields: 'Name', 'Email', 'Username', and 'Temporary password', followed by 'Clear' and 'Save' buttons. The 'Customer list' panel on the right shows a table with 5 rows, each representing a customer (C0-1 to C0-5) with an 'active' status indicator. The top right corner of the page shows a 'Sign out' button.

From this page a user can be created, and all of the Customer can be seen in a list format. Only the Support role can view this page, since only Support has the authority to make new users. This page is not available for the Consultant or Customer role.

MoSCoW Requirement Classification & User Story Transformation

1. Introduction

This document shows the requirements of the eMagiz Ticketing System using MoSCoW method and turns them into user stories. This document helps to define the project and also assists the team to make development efforts, by establishing a structured roadmap for implementation in further weeks.

Most of the requirements are also on the Trello account. The requirements have been classified using MoSCoW in the following way:

- **Must Have** : what is absolutely essential for system functionality
- **Should Have** : what is important however it is not critical
- **Could Have** : optional enhancements to upgrade the ticketing system
- **Won't Have** : excluded from the project altogether

2. Must Have Requirements

Requirement	User Story
Secure user login	As a user, I want to log in securely so that my account is protected.
Role-based access control	As a Support user, I want different user roles so that Customers, Consultants and Support users only access the features they are allowed to use.
Ticket creation	As a Customer, I want to create a ticket so that I can report an issue or request.
Customer account management	As a Support user, I want to create and manage Customer accounts so that new Customers can access the system.
Ticket assignment	As a Support user, I want to assign tickets to Consultants so that work is distributed efficiently.
Ticket workflow management	As a Support user, I want to update ticket statuses so that ticket progress can be tracked.

Audit logging	As a Support user, I want to view an audit log so that important actions performed in the system can be tracked.
Database persistence	As a user, I want my tickets and account information to be saved so that my data is still available the next time I log in.

3. Should Have Requirements

Requirement	User Story
Ticket comments	As a Consultant, I want to add comments to tickets so that updates and progress are documented.
Ticket priority levels	As a Support user, I want to assign priorities to tickets so that urgent issues are handled first.
Ticket search functionality	As a user, I want to search tickets so that I can quickly locate relevant issues.
Ticket filtering	As a user, I want to filter tickets by status or priority so that workload management becomes easier.
Dashboard overview	As a user, I want a dashboard view so that I can monitor ticket activity efficiently.
Input validation	As a user, I want invalid information to be rejected so that incorrect data is not submitted.

4. Could Have Requirements

Requirement	User Story
-------------	------------

Notification history	As a user, I want to view past notifications so that I can track updates.
Dark mode / UI customization	As a user, I want interface customization options so that usability is improved.
Analytics and reporting	As an admin, I want system analytics so that ticket trends can be monitored.
Attachment uploads	As a Customer, I want to upload files to tickets so that additional issue details can be provided.

5. Won't Have Requirements

Requirement	Reason for Exclusion
AI-based ticket classification	Outside the scope of the current module
Real-time chat Support	Adds unnecessary complexity for the current sprint
Mobile application Support	Web application is prioritized first
Multi-language Support	Not required for initial implementation
Advanced enterprise analytics	Considered a future enhancement
